US DoE funding *Market Acceleration*
projects to advance market acceptance

Industry Development Issues

DoE selected projects that specifically address the following key issues:

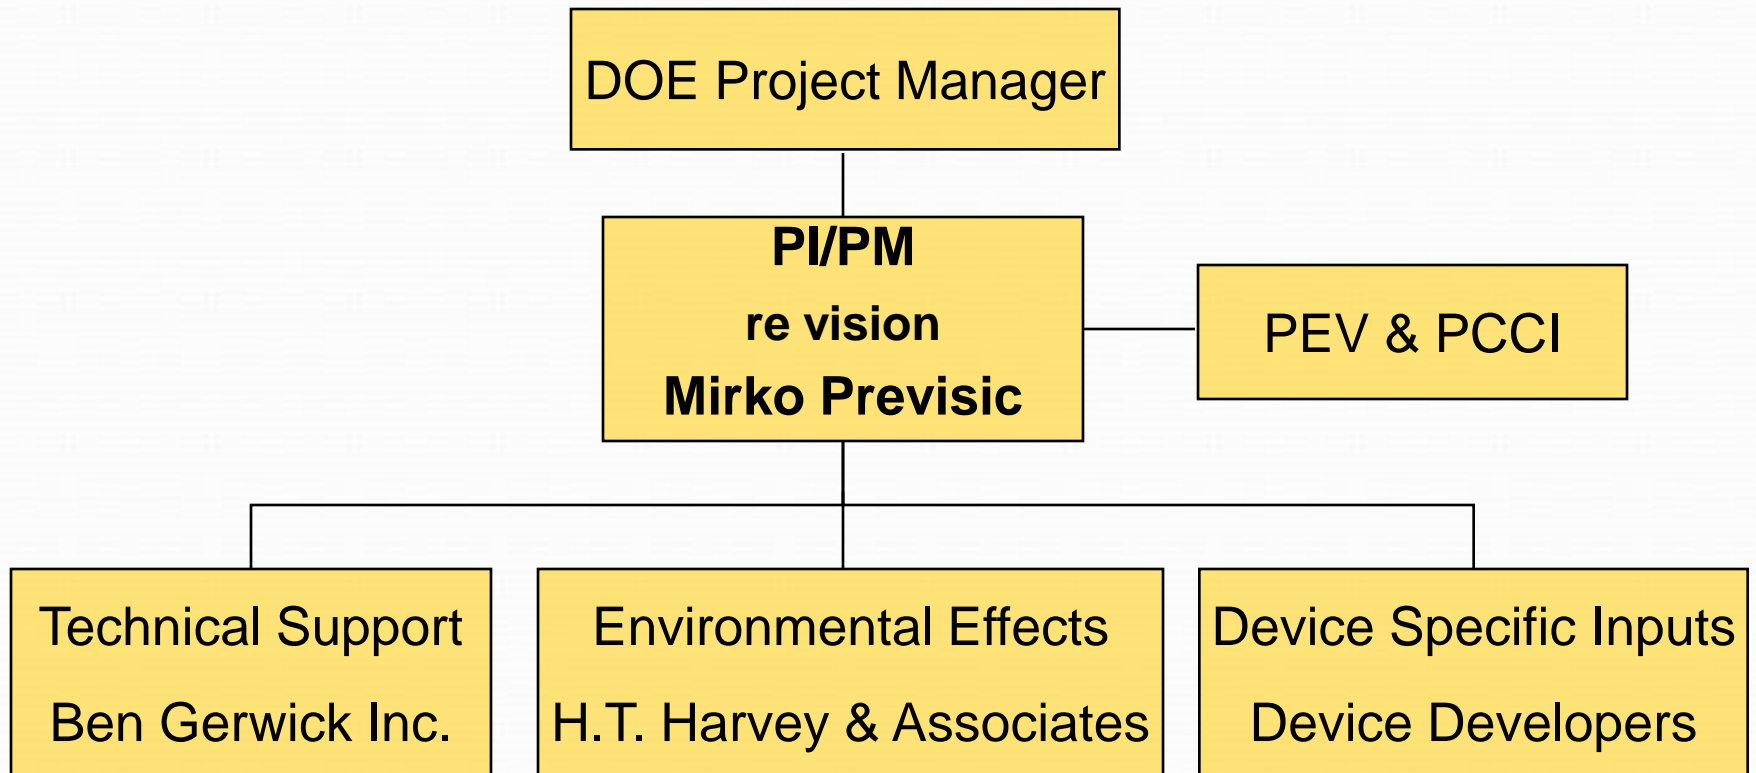

Environmental
Uncertainties

Navigational
Impacts

Technological
Uncertainties

Regulatory
Framework

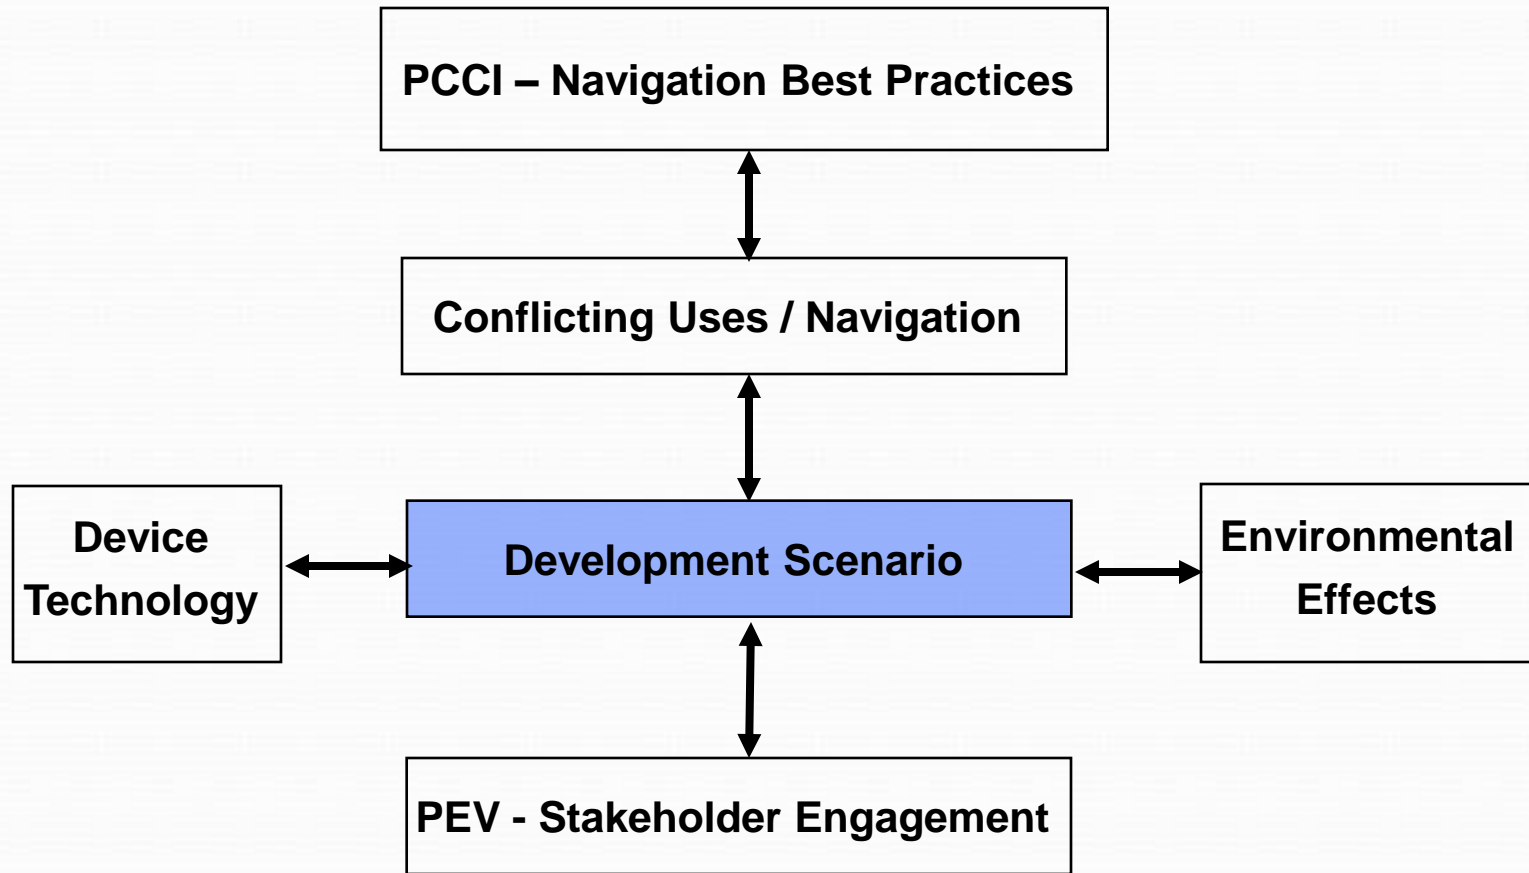

Project Organization

Evaluation of Environmental & Navigational Impacts

- A wide range of different device concepts
- Technological uncertainty introduces environmental effects uncertainty
- **GOAL:** Provide a clear understanding of the potential impacts of these technologies, considering different technological approaches, deployment scales, and future sites in the U.S.

Capture important elements

Strategy

Baseline scenarios: Consider major technical approaches at different scales

Framework for
Environmental Effects

Framework for
Navigational Effects

Outcome:

To provide a clear understanding of enviro & navigational effects

To establish a framework for the evaluation of environmental effects

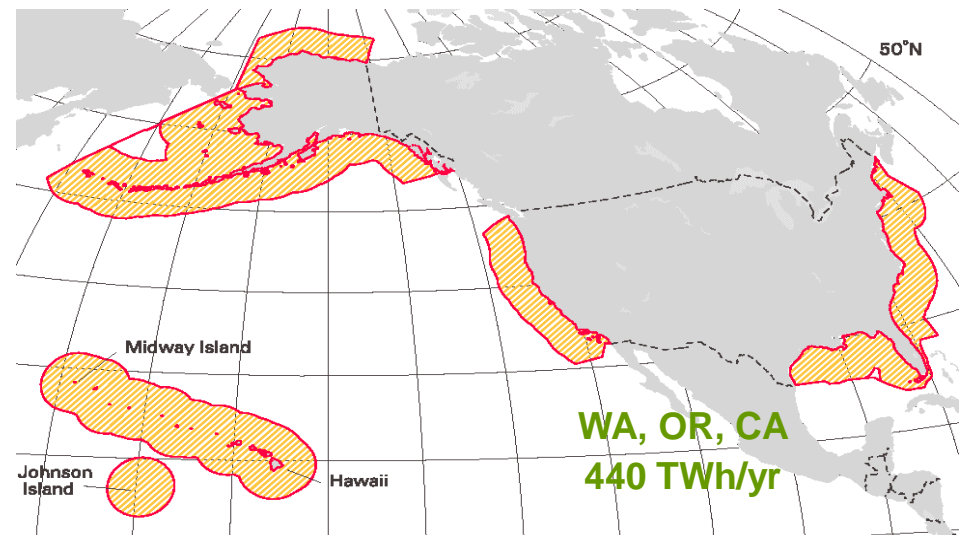

Environmental Assessment Framework

Important criteria:

- decision analysis
- identify uncertainties
- apparent to all

Address environmental issues:

- generic
- site-specific

Geographical Priority - Wave Energy

- Alteration of habitat/physical environment
- Proximity of project to important habitats
- Noise
- EMF
- Lighting
- Chemical

Lohse et al. 2008

Figure 4.3: Hypothetical relationship between wave energy and the dominance of *Macrocyctis* and *Nereocystis*

- species
- habitats
- life stages of concern
 - ontogeny
 - migration
- spatial/temporal distribution
 - species range
 - use of specific habitats (seasonal, life stage)

Conceptual models:

- driver-linkage-outcome approach
- nature and direction of effect
- importance or magnitude
- understanding underlying effect
- predictability

Transparency:

State all assumptions

- magnitude and certainty of outcomes
- positive vs. negative outcomes
- identify gaps in knowledge
- rank risk vs. worth
- reversibility
- opportunities for learning

LIKELIHOOD OF OCCURRENCE	SEVERITY OF CONSEQUENCES				
	Negligible	Minor	Major	Severe	Disastrous
Virtually certain	Significant	Significant	Intolerable	Intolerable	Intolerable
Likely	Moderate	Significant	Intolerable	Intolerable	Intolerable
Unlikely	Negligible	Moderate	Significant	Intolerable	Intolerable
Rare	Negligible	Negligible	Moderate	Significant	Intolerable
Virtually impossible	Negligible	Negligible	Moderate	Significant	Significant

Risk Level:		Negligible risk — Incorporate cost effective risk reduction strategies within the scope of long term planning.
		Moderate risk — Implement cost effective measures for risk reduction, and formalise routine procedures for reducing risk.
		Significant risk — Implement cost effective measures for risk reduction and assign senior management responsibility.
		Intolerable risk — Cannot be justified under any circumstances; implement risk reduction measures to reduce risk to lower level.

(University of British Columbia, Fisheries Centre 2006)

Why analyze scenarios?

- Technology diversity
- Deployment Scales → Cumulative impacts
- Establish a solid technical baseline as a primary strategy to reduce uncertainties

Oscillating water column devices and attenuators

Oscillating water column device: Oceanlinx.

Attenuator: Pelamis

Overtopping devices and point absorbers

Overtopping device: Wave Dragon

Point absorber: AquaBuOY

(Nelson et al. 2008)

Capturing the effects of deployment scale is important to evaluate cumulative effects

Scale	Size	Cumulative effect
Pilot plant	1 to 3 units in array	Likely not measurable
Small commercial	10-20 MW	Measurable
Commercial plant	> 100 MW	Measurable

Why analyze scenarios?

- Technology diversity ✓
- Deployment Scales → Cumulative impacts ✓
- Establish a solid technical baseline as a primary strategy **to reduce uncertainties**
